# Sonar for Panta

The intelligence layer for on-chain prediction markets. Behavioural signals, cross-venue pricing and one-click non-custodial trading, built on the Panta API on Solana.

## PROBLEM

# An API gives you prices. It does not give you a read.

- Prediction markets became infrastructure in 2026: Kalshi and Polymarket cleared **\$44.8B in a single month** (June). Almost all of it off-chain, US-centric, permissioned.
- Panta puts permissionless market creation and trading on Solana behind a clean API. But an integrator gets a price and a tape, not history, not analytics, not a view of whether a Panta market is cheap or rich versus the rest of the world.
- Traders, creators and bots on Panta fly blind. Thin catalogs stay thin because nobody can see where the edge is.
- Nigeria has **~60M active bettors** and a **\$3.6B** betting market, football-first and 83% mobile, and **zero** on-chain markets about Nigerian events.

- **Radar.** Every market Panta exposes, scored from its own trade tape and priced against Polymarket and Kalshi.
- **Market.** The read with reasons, our own price history, cross-venue gap, resolution rule, full tape.
- **Trade.** Quote, sign in your wallet, broadcast, attribute. Non-custodial end to end.
- **Portfolio.** Positions marked to live prices, one-click claims.
- **Create.** Headline to resolvable market, Claude drafting the rule, Nigeria starter boards.

- **Agent.** Unattended paper (or live) trading on every call, settled against Panta's resolutions.

## HOW IT WORKS

# The read is built from the tape, not from vibes.

- **Flow imbalance:** YES minus NO share flow over the last 24h (or last 20 prints when thin).
- **Momentum:** YES price now vs our oldest snapshot inside 24h. Panta has no history endpoint, so Sonar records one every 10 minutes.
- **Whale share and concentration:** how much of the tape is one print or one wallet (HHI).
- **Cross-venue gap:** the same question's YES price on Polymarket or Kalshi minus Panta's.
- Composite in  $-100..100$ :  $0.45 \cdot \text{gap} + 0.25 \cdot \text{flow} + 0.2 \cdot \text{momentum} + 0.1 \cdot \text{whale}$ , discounted for thin, stale or single-wallet tape, zero after close.

### TWO CALLS FROM THE PANTA BACKTEST

“Will there be an eviction AND will the first housemate evicted from BBNaija Season 11 on Sunday, August 16, 2026...?”

Sonar at 60% of the tape: **NO 12** with YES at 12¢. Outcome: **NO**. Hit.

“Will Max Verstappen win the 2026 Dutch Grand Prix Main Race?”

Sonar: **NO 13** with YES at 11¢. Outcome: **NO**. Hit. The same question traded on Polymarket (match 0.74), which is where the cross-venue gap comes from when both are open.

The matcher only pairs questions that share a subject (a name, a ticker, a specific number). No match is reported rather than a wrong one.

# Non-custodial, attributed, on mainnet.

`POST /trades (attribution)`

- Same pattern for claims (`/claim/build`) and market creation (`/markets/create/quote` → `build` → `register`).
- 14 Panta endpoints integrated behind a typed, rate-limited server client. The API key never reaches the browser.
- Stable Panta error codes map to plain-language UI: stale quote, expired quote, market left primary, insufficient USDC.

PANTA API ISSUES DOCUMENTED FOR THE TEAM

- Sonar has run live on Kalshi and Polymarket since mid-2026 (sonar.nodalytics.xyz). This build ports the engine to Pantaverse's on-chain tape and adds what Pantaverse does not expose.
- The Pantaverse backtest replays the first 60% of each resolved tape through the same function (80% hit rate). Pantaverse's catalog is young, so the sample is small and reported as-is. The agent has been paper-trading every call since 19 September and settles against Pantaverse's own resolutions.

# The first Nigerian prediction markets, on Solana, priced honestly.

- Nigerians already price everything: CBN rate decisions, the NBS inflation print, the naira, NGX, Super Eagles fixtures, fuel prices. Today that happens on bookmakers with a 10–20% overround and in naira that loses value while the bet is open.
- Panta markets are USDC-settled, parimutuel, permissionless and 2-hour resolvable. Sonar's Create page ships Nigeria starter boards so a creator can list the week's questions in minutes and earn a share of every trade.
- Sonar then does what no bookmaker does: shows the crowd where each market is mispriced against the global tape, and lets them act on it from their own wallet.
- Distribution: Superteam Nigeria's builder and trader community, Solana Mobile, and the university communities where the author teaches and studies.

# Three revenue lines, one engine.

## Creator fees

Sonar creates and seeds the markets its signals say the world is missing (starting with Nigeria) and earns Panta creator fees on every trade they attract.

[LIVE ON PANTA TODAY](#)

## Attribution and order flow

Every trade routed through Sonar is reported to Panta with attribution. Panta partners share in the activity they bring; Sonar is built to be the integration that brings it.

[PANTA PARTNER TERMS](#)

## Sonar Pro

The signal and cross-venue feed as a paid API and embeddable widget for bots, creators and other Panta integrations; later, a managed agent vault.

[Q1 2027](#)

- Costs are near zero: one Vercel deployment, one Redis, a scheduled job. The signal engine is deterministic; Claude is used only for drafting.
- Venue-neutral by design: the same engine already runs on Kalshi and Polymarket, so Sonar is also the bridge that shows off-chain traders where Solana is mispriced.

## ROADMAP

# Next 90 days.

### OCTOBER

- Live agent capital on primary windows
- Nigeria board: 10 markets live, weekly cadence
- Panta API feedback loop with the Panta team

### NOVEMBER

- Secondary-market trading when Panta ships the endpoints
- Embeddable Radar widget for creators and communities
- Telegram alerts on new calls and primary windows

### DECEMBER

- Sonar Pro API (signals + cross-venue feed)
- Mobile-first PWA for Nigerian traders
- Colosseum accelerator or Solana Foundation grant milestone plan

## TEAM

# Great Ojietohamen · GreYat Labs, Lagos

- Solo founder-engineer. Ships trading infrastructure on Solana: onchain-rbac (Solana Foundation grant), smart-tx-stack, worldcup-match-vault (trustless TxLINE settlement), GroupStage.
- Runs Sonar, a live behavioural-signal engine on Kalshi and Polymarket with a public track record.
- Everything in this repository was written during the hackathon window against the Panta API. MIT licensed. Signal design carried over from the author's off-chain product and disclosed.
